## Course Information.

- Exam \# 1:

Any changes in the grading of the exam can only be made me.
Please provide today (Thursday 10/5) with your exam and a note describing why you feel you deserve more points.

- Laboratory:
- Laboratory experiment \# 3 is scheduled for Monday October 9.
- Homework:
- Homework set \#4 is due on Friday 10/6 at 12 pm (noon).
- Homework set \#5 is due on Friday 10/13 at 12 pm (noon).

## The energy principle $(Q=0)$.

Multi-particle systems.

- When we apply our equation for the change in the energy of our system, we have to realize that how we treat forces depends on how we define out system.

$$
\sum_{i} \Delta E_{i}+\left(-W_{\text {int }}\right)=\sum_{i} \Delta E_{i}+\Delta U=W_{\text {ext }} \quad \begin{aligned}
& \text { Change in energy } \\
& \text { of our system }
\end{aligned}
$$

- Consider an object in free fall close to the surface of the Earth:
- If our system consists of the object and the Earth, the gravitational force is an internal force and we will include it in the calculation of the potential energy of our system. Since the relative position of the object and the Earth will change, the change in $U$ will not be equal to

0. 

- If our system consists of the object only, the gravitational force is an external force and will be included in our calculation of the work associated with external forces.
Frank L. H. Wolfs Department of Physics and Astronomy, University of Rochester, Lecture 10, Page 8
8

Calculating the potential energy $U$.
One dimension.

- Per definition, the change in potential energy is related to the work done by the force:

$$
\Delta U=-W=-\int_{x_{0}}^{x} F(x) d x
$$

- The potential energy at $x$ can thus be related to the potential energy at a point $x_{0}$ :

$$
\begin{array}{cc}
U(x)=U\left(x_{0}\right)+\Delta U=\underbrace{U\left(x_{0}\right)}_{0}-\int_{x_{0}}^{x} F(x) d x \\
\begin{array}{c}
U(x) \text { only uniquely defined if } \\
\text { integral is path independent. }
\end{array} \\
\begin{array}{c}
\text { Refential at reference position. }
\end{array} \\
\text { Department of Physics and Astronomy, University of Rochester, Lecture i0, Page } 9
\end{array}
$$

## Calculating the potential energy.

Path dependence.

- The work done must only depend
on the start and end point, and not
on the path followed.
- This is not true for all forces. For
example, the work done by the
friction force is always negative.
If the friction force is constant in
magnitude, the work done by the
friction force depends on the path
length and is thus path dependent.

| Calculating the potential energy. <br> Conservative and non-conservative forces. |
| :--- | :--- | | - If the work is independent of the |
| :--- |
| path, the work around a closed |
| path will be equal to 0 J. |
| - A force for which the work is |
| independent of the path is called |
| a conservative force. |
| - A force for which the work |
| depends on the path is called a |
| non-conservative force. |

Calculating the potential energy. $\qquad$ The potential energy of a spring.

- Consider the work done by a
spring when we move a block
from its equilibrium position to a position $x=A$.
During this displacement, the force is pointed in a direction opposite to the displacement, and the work done is negative.
- The total work done is equal to

$$
W=-\int_{0}^{A}(k x) d x=-\frac{1}{2} k A^{2}
$$

- The potential energy of the spring is thus $U(x)=-W=(1 / 2) k x^{2}$

$\qquad$
$\qquad$
$\qquad$
$\qquad$ energy at this position is 0 J

14

Calculating the potential energy. $\qquad$
The gravitational potential energy.
In our discussion so far we have
taken the gravitational potential energy to be equal to $m g h$

- This is approximately correct when we are very close to the surface of the earth, but not correct when we are a few miles from the surface of the earth
- The work done by the gravitational force when we move an object from position 1 to position 2 is equal to

Note: reference position is at infinity. The potential energy at this position is 0 J .

| Calculating the potential energy. The electric potential energy. |  |
| :---: | :---: |
| - The electric force between two charged particles is equal to |  |
| $\vec{F}_{c}=\frac{1}{4 \pi \varepsilon_{0}} \frac{q q_{2}}{r_{2}} \hat{r}_{2}$ |  |
| - The electric potential energy required to assemble a pair of charges can be found in the same way we determine the gravitational potential energy. We find that |  |
| $U_{e}=\frac{1}{4 \pi \varepsilon_{0}} \frac{q_{12} q_{2}}{r_{12}}$ | Note: reference position is at infinity. The potential energy at this position is 0 J . |

17

$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
The potential energy is directly related to the force acting on the object.

- If we know the force, we can
calculate the change $\Delta U$ : calculate the change $\Delta U$

$$
\Delta U=-W=-\int_{x_{0}}^{x} F(x) d x
$$

If we know the change $d U$, we can calculate the force:

$$
F(x)=-\frac{d U}{d x}
$$

| Potential energy distributions. <br> The gravitational potential energy. |  |  |
| :--- | :--- | :---: |
| - Consider an object on the surface of the |  |  |
| earth with a kinetic energy $K\left(r_{\mathrm{E}}\right)$. The |  |  |
| total energy of the object is $U\left(r_{\mathrm{E}}\right)+$ |  |  |
| $K\left(r_{\mathrm{E}}\right)$. |  |  |
| - If $U(r \mathrm{E})+K(r \mathrm{E})<0$ then there will be a |  |  |
| distance $r$ where $U(r)=U(r \mathrm{E})+K(r \mathrm{E})$. |  |  |
| At that distance $K(r)=0 \mathrm{~J}$. The object |  |  |
| can not escape! |  |  |

3
Calculating the potential energy.
The atomic potential energy.

| - The force between neutral atoms |
| :--- |
| is largely governed by the electric |
| force between their constituents. |
| - The net force has contributions |
| due to the repulsive force |
| between the protons and between |
| the electrons in each atom, and |
| the attractive force between the |
| protons in one nucleus and the |
| electrons in the other nucleus |
| (and vice versa). |
| - The potential energy between two |
| neutral atoms is parameterized in |
| terms of the Morse function. |
| Department of Physics and Astronomy, University of Rochester, Lecture 10, Page 24 |

Frank $L$ in Wolfs

| Calculating the potential energy. The atomic potential energy. |  |
| :---: | :---: |
| - The Morse potential energy distribution is in approximate agreement with the results of measurements of the inter-atomic force. <br> - The region surrounding the equilibrium position may be approximated with the potential distribution of a harmonic oscillator (e.g. a spring). <br> - For small oscillations around the equilibrium position, the spring model will work nicely! | Note: this will be discussed in more detail in chapter 7. |
