Physics 235, Midterm Exam # 2

October 22, 2019: 8.00 am - 9.30 am

Do not turn the pages of the exam until you are instructed to do so.

Exam rules: You may use only a writing instrument while taking this test. You may not consult any calculators, computers, books, nor each other.

Problems 1 and 2 must be answered in exam booklet 1. Problems 3 and 4 must be answered in exam booklet 2. The answers need to be well motivated and expressed in terms of the variables used in the problem. You will receive partial credit where appropriate, but only when we can read your solution. Answers that are not motivated will not receive any credit, even if correct.

At the end of the exam, you need to hand in your exam, the blue exam booklets, and the equation sheet. All items must be clearly labeled with your name, your student ID number, and the day/time of your recitation. If any of these items are missing, we will not grade your exam, and you will receive a score of 0 points.

You are required to complete the following Honor Pledge for Exams. Copy and sign the pledge before starting your exam.

“I affirm that I will not give or receive any unauthorized help on this exam, and that all work will be my own.”

INTENTIONALLY LEFT BLANK
Useful Relations:

\[
\begin{align*}
\cos(30^\circ) &= \frac{1}{2}\sqrt{3} & \sin(30^\circ) &= \frac{1}{2} & \tan(30^\circ) &= \frac{1}{3}\sqrt{3} \\
\cos(45^\circ) &= \frac{1}{2}\sqrt{2} & \sin(45^\circ) &= \frac{1}{2}\sqrt{2} & \tan(45^\circ) &= 1 \\
\cos(60^\circ) &= \frac{1}{2} & \sin(60^\circ) &= \frac{1}{2}\sqrt{3} & \tan(60^\circ) &= \sqrt{3} \\
\cos \left( \frac{1}{2}\pi - \theta \right) &= \sin(\theta) & \sin \left( \frac{1}{2}\pi - \theta \right) &= \cos(\theta) \\
\cos(2\theta) &= 1 - 2\sin^2(\theta) & \sin(2\theta) &= 2\sin(\theta)\cos(\theta)
\end{align*}
\]

Good Luck!
Consider a thin uniform spherical shell of mass $M$ and radius $R$. The center of the shell is located at the origin of our coordinate system.

a. Consider a thin ring on the shell at a polar angle $\theta$ and with an angular width $d\theta$, as shown in the Figure below.

Find the gravitational potential $\Phi$ due to this ring at a distance $r$ from the center of the spherical shell. Assume $r > R$.

b. Find the total gravitational potential $\Phi$ at a distance $r$ from the center of the spherical shell by integrating the expression obtained in part a) over all possible values of $\theta$.

c. Use the result obtained in b) to determine the gravitational field (magnitude and direction) of the spherical shell at a distance $r$ from its center. Assume $r > R$.

d. Use the expression of the gravitational field obtained in part c) to determine the magnitude and the direction of the gravitational force on point mass $m$ at a distance $r$ from the center of the spherical shell. Assume $r > R$.

Your answers must be well motivated and expressed in terms of the variables provided.

NOTE: You cannot use the shell theorem to solve this problem.
PROBLEM 2 (25 POINTS)

Consider a right-circular cylinder of fixed volume $V$. The cylinder has a radius $R$ and a height $H$. Our goal is to minimize the surface area $A$.

a. What is the surface area of the cylinder in terms of the coordinates $R$ and $H$?

b. What is the equation of constraint?

c. Determine the two Euler equations that must be satisfied by $R$ and $H$. Note: these equations can contain Lagrange undetermined multiplier(s). You do not need to determine these multipliers.

d. Solve the equations found in step c) to determine the ratio of $R$ and $H$ that minimizes the surface area $A$.

Your answers must be well motivated and expressed in terms of the variables provided.
PROBLEM 3 (25 POINTS)

A particle of mass $m$ starts at rest on top of a smooth fixed hemisphere of radius $a$.

We will express the motion of the particle in terms of the generalized coordinates $r$ and $\theta$.

a. What is the equation of constraint when the particle moves across the surface?

b. What is the Lagrangian describing this motion? Express $L$ in terms of the generalized coordinates $r$ and $\theta$.

c. Find the Lagrange equations of motion.

d. Use the equations of motion found in part c) and the equation of constraint found in part a) to find the differential equation for $\theta$.

e. Find the Lagrange undetermined multiplier(s). You can express the Lagrange undetermined multiplier(s) in terms of $\theta$ and $\dot{\theta}$.

f. Explain how you use the result of part e) to determine the angle $\theta$ at which the particle leaves the hemisphere.

Your answers must be well motivated and expressed in terms of the variables provided.
a. Consider a path on the surface of a cylinder of radius $\rho$. Use cylindrical coordinates $(r, \phi, z)$ to describe this path.

https://www.encyclopediaofmath.org/index.php/Helical_line

What is the equation of constraint you would use for this system?
b. Consider the gravitational potential $V$, generated by two point masses, shown as function of $x$ and $y$ in the following Figure.

Where are the two masses located and what is their mass ratio?
c. Consider light passing from one medium with index of refraction $n_1$ into another medium with index of refraction $n_2$, as shown in the following Figure.

The $x$ axis is defined by the interface between the two media and the $y$ axis is perpendicular to this surface (represented by the dashed line in the Figure).

What would you use as your independent variable when you derive the law of refraction?
d. A particle of mass $m$ slides down a smooth circular wedge of mass $M$ as shown in the Figure below. The wedge rests on a smooth horizontal table.

What generalized coordinates would you use to construct the Lagrangian and/or the Hamiltonian?
e. In which country was Didi Gregorius born?

1. The United States.
2. Aruba.
5. China.
7. Australia.
8. Curacao.
10. The Netherlands.
11. Cuba.
12. Brazil.
15. Costa Rica.
16. France.
17. Greece.
18. Egypt.
19. Mexico.
20. South Africa.
