Physics 121, April 1, 2008.
Equilibrium.

• Course Information
• Discussion of Exam # 2
• Topics to be discussed today:
  • Requirements for Equilibrium
  • Gravitational Equilibrium
  • Sample problems

• Homework set # 7 is due on Saturday morning, April 5, at 8.30 am. This assignment has two components:
  • WebWork (75%)
  • Video analysis (25%)

• Homework set # 8 will be available later this week. This assignment will be due on Saturday morning, April 12, at 8.30 am.
• Exam # 2 will be returned in workshops this week.
Midterm Exam # 2.

Midterm Exam # 2.

Results.

Midterm Exam # 2.

Results.

Midterm Exam # 2.

What now?

• What do you learn from your results up to now?
  • Exam 1 and Exam 2 > 60%: everything is OK.
  • Exam 1 and Exam 2 < 40%: you need help! Please set up a time to meet with me. Things are not going to get easier.
  • 40% < Exam 1 and Exam 2 < 60%: you probably will pass the course, but changing your work habits might result in a better grade. Look at the exam and its solutions and determine what you are missing (e.g. do you have a problem applying the correct approach, do you have problems working with variables, etc.).
  • Note: even those students with 0% on Exam # 1 and Exam # 2 can still pass the course with a B+ or A-! But you need to act now!!!!!
Equilibrium.

An object is in equilibrium if the following conditions are met:

Net force = 0 N (first condition for equilibrium)

and

Net torque = 0 Nm (second condition for equilibrium)

Note: both conditions must be satisfied. Even if the net force is 0 N, the system can start to rotate if the net torque is not equal to 0 Nm.

Static Equilibrium.

What happens when the net force is equal to 0 N?
- P = constant

What happens when the net torque is equal to 0 Nm?
- L = constant

We conclude that an object in equilibrium can still move (with constant linear velocity) and rotate (with constant angular velocity).

Conditions for static equilibrium:
- P = 0 kg m/s
- L = 0 kg m²/s

Equilibrium.
Summary of conditions.

Equilibrium in 3D:

\[ \sum F_x = 0 \quad \sum F_y = 0 \quad \sum F_z = 0 \quad \sum \tau_x = 0 \quad \sum \tau_y = 0 \quad \sum \tau_z = 0 \]

Equilibrium in 2D:

\[ \sum F_x = 0 \quad \sum F_y = 0 \quad \sum \tau_x = 0 \]

Equilibrium.
Be sure to include all forces!!!

- When evaluating conditions for equilibrium, you need to make sure to include all forces acting on the system.
- In the system shown in the Figure, there are more forces acting on the system than the forces indicated. For example, there should be an upward force to balance the downward forces.
- Of course, the problem is how to apply the equilibrium conditions correctly.

Equilibrium.
The force of gravity.

- Consider an extended rigid object that can rotate around a specific rotation point.
- If the rotation point coincides with the center-of-gravity of the object, it will be in static equilibrium in any orientation.
- What is the relation between the position of the center of mass and the position of the center of gravity?

Equilibrium.
The force of gravity.

- If the object is in equilibrium, the net torque and the net force acting on it must be equal to 0.
- The net force acting on the object is equal to
  \[ \sum F = \sum (F^i + \sum \Delta N) = \sum F^i = M_g \]
- If the net force is equal to 0 N, we must require that
  \[ F^i = M_g \]
Equilibrium. The force of gravity.

• The condition that $F' = MF$ is not sufficient for static equilibrium. We must also require that the net torque is equal to 0 Nm.

• The net torque acting on the object is equal to

$$\sum F = \sum [F \times (\Delta m \Delta)] = (\sum \Delta m \Delta f) \times g = MF \times g$$

• If the net torque must be 0 Nm, we must require that

$$Mr \times g = 0$$

Equilibrium. The force of gravity.

• The system will be in equilibrium if

$$Mg = Mg$$

• The requires that

- The center-of-gravity is located exactly below or above the rotation axis ($r_{cm}$ parallel to vertical axis).

- The center-of-gravity coincides with the rotation axis ($r_{cm} = 0$)

Sample problem 1.

• A uniform beam of length L whose mass is m, rest with its ends on two digital scales. A block whose mass is M rests on the beam, its center one-fourth away from the beam’s left end. What do the scales read?

$$\sum F_y = F_y + F_y = Mg - mg = 0$$
Equilibrium.
Sample problem 1.

• If the system is in equilibrium, the net torque must be 0 Nm.
• Note: the torque associated with a force depends on the choice of the origin. The condition that the torque must be 0 Nm must be satisfied with respect to any choice of origin.
• If we choose the left scale as our origin, the left “scale” force does not appear in our torque equation:

\[ F_l = L \frac{mg}{2} - Mg = 0 \]

Equilibrium.
Sample problem 1.

• The force generated by the right scale is thus equal to

\[ F_r = \frac{Mg + mg}{2} = \frac{1}{4} Mg + \frac{1}{2} mg \]

• We can now use the first condition of equilibrium to determine the force generated by the left scale:

\[ F_l = Mg + mg - F_r = \frac{1}{4} Mg + \frac{1}{2} mg \]

Equilibrium.
Sample problem 2.

• A ladder with length L and mass m rests against a wall. Its upper end is a distance h above the ground. The center of gravity of the ladder is one-third of the way up the ladder. A firefighter with mass M climbs halfway up the ladder. Assume that the wall, but not the ground, is frictionless. What is the force exerted on the ladder by the wall and by the ground?
Equilibrium. Sample Problem 2.

- Forces exerted by the wall and the floor:
  - The wall exerts a horizontal force (normal force).
  - The floor exerts a vertical force (normal force) and a horizontal force (friction force).
- Note: the friction force must be present in order to ensure that the net force in the horizontal direction adds up to 0 N.

Equilibrium. Sample Problem 2.

- The first condition for equilibrium requires that
  \[ \sum F_x = 0 \]
  \[ \sum F_y = 0 \]
  Two equations with three unknowns. We need more information! But we still have the second condition for equilibrium.

Equilibrium. Sample Problem 2.

- The second condition for equilibrium requires:
  \[ \sum \tau = 0 \]
  Note: we have used to resting point on the ground as out reference point. The torque due to the two forces acting on this point do not contribute to the torque with this choice of reference point. We can now determine \( F_w \) easily:
  \[ F_w = \frac{Mg \frac{a}{2} + mg \frac{a}{3}}{h} \]
Equilibrium.

Sample Problem 2.

- By examining the net force in the horizontal direction, we can determine the friction force:

\[ F_x = F_\text{friction} = \frac{\mu}{\mu_s} \left( \frac{1}{2} M + \frac{1}{3} m \right) \]

- Note: the frictional force depends on the position of the firefighter and increases when the firefighter climbs the ladder.
- Since the frictional force must be less than \( \mu F_{\text{friction}} \), there may be a maximum height that can be reached by the firefighter above which the ladder will slip.

---

Equilibrium.

- Let’s test our understanding of the basic aspects of equilibrium by working on the following concept problems:
  - Q19.1
  - Q19.2

---

Stress and strain.

The effect of applied forces.

- When we apply a force to an object that is kept fixed at one end, its dimensions can change.
- If the force is below a maximum value, the change in dimension is proportional to the applied force. This is called Hooke’s law:

\[ F = k \Delta L \]

- This force region is called the elastic region.
Stress and strain.
The effect of applied forces.

- When the applied force increases beyond the elastic limit, the material enters the **plastic region**.
- The elongation of the material depends not only on the applied force \( F \), but also on the type of material, its length, and its cross-sectional area.
- In the plastic region, the material does not return to its original shape (length) when the applied force is removed.

### Elongation

The elongation \( \Delta L \) can be specified as follows:

\[
\Delta L = \frac{F}{E} \frac{L_0}{A}
\]

where:
- \( L_0 \) = original length
- \( A \) = cross sectional area
- \( E \) = Young’s modulus

- **Stress** is defined as the force per unit area (= \( F/A \)).
- **Strain** is defined as the fractional change in length (\( \Delta L/L_0 \)).

Note: the ratio of stress to strain is equal to the Young’s Modulus.

Stress and strain.
The effect of applied forces.

- Direction matters.
Stress and strain. A simple calculation could have prevented the death of 114 people.
