3

Final remarks about Chapter 12. Solving coupled oscillator problems.

- Follow these steps in order to solve most coupled oscillator problems:
 - Choose generalized coordinates.
 - Determine the A and m tensors.
 - Determine the eigen frequency and the eigen vectors.
 - Determine the scale factors required to match the initial conditions.
 - Determine the normal coordinates.

4

Course Information.

- If you did not pick up Exam # 3 during lecture last week, you can pick it up during recitations this week.
- Any requests for regrades for specific problems on Exam # 3 should be made by Monday December 8 (end of lecture). I will need the following:
 - Your blue book(s).
 - A written explanation why you feel you deserve more points.
- I have graded about 20% of the term papers. I will return each paper as soon as I have graded it, but I will not complete this until sometime next week.

Problem 12.21.

Three oscillators of equal mass m are coupled such that the potential energy of the system is given by

$$U = \frac{1}{2} [\kappa_1 (x_1^2 + x_3^2) + \kappa_2 x_2^2 + \kappa_3 (x_1 x_2 + x_2 x_3)]$$

where

$$\kappa_3 = \sqrt{2\kappa_1\kappa_2}$$

Find the eigen frequencies by solving the secular equation. What is the physical interpretation of the zero-frequency mode?

Frank L. H. Wolfs

6

General steps to solve this type of problems.

- Find $\{A\}$.

$$\{A\} = \begin{bmatrix} \kappa_1 & \frac{1}{2}\kappa_3 & 0 \\ \frac{1}{2}\kappa_3 & \kappa_2 & \frac{1}{2}\kappa_3 \\ 0 & \frac{1}{2}\kappa_3 & \kappa_1 \end{bmatrix} \quad \left| \begin{array}{ccc} \kappa_1 - m\omega^2 & \frac{1}{2}\kappa_3 & 0 \\ \frac{1}{2}\kappa_3 & \kappa_2 - m\omega^2 & \frac{1}{2}\kappa_3 \\ 0 & \frac{1}{2}\kappa_3 & \kappa_1 - m\omega^2 \end{array} \right| = 0$$

- Solve secular determinant.

- Find $\{m\}$.

$$\{m\} = \begin{bmatrix} m & 0 & 0 \\ 0 & m & 0 \\ 0 & 0 & m \end{bmatrix}$$

8

The loaded string. Motion in the vertical direction.

Frank L. H. Wolfs

Department of Physics and Astronomy, University of Rochester, Slide 9

9

The loaded string.

- General solution:

$$q_j(t) = \sum_s \beta_s \sin\left(j \frac{s\pi}{(n+1)}\right) e^{i\omega_s t}$$

- The frequency is given by

$$\omega_s = 2\sqrt{\frac{\tau}{md}} \sin\left(\frac{s\pi}{2(n+1)}\right)$$

10

4 Minute 47 Second Intermission.

- Since paying attention for 1 hour and 15 minutes is hard when the topic is physics, let's take a 4 minute 47 second intermission.

- You can:
 - Stretch out.
 - Talk to your neighbors.
 - Ask me a quick question.
 - Enjoy the fantastic music.

11

Chapter 13: Waves.

- Consider the following:

- Increase the number of masses n to infinity.
- Decrease the distance d to zero such that $(n+1)d = L$.
- Decrease the mass m to zero such that $m/d = \text{constant}$.

- In this case, the displacement q can be written as:

$$q_j(t) = \sum_s \beta_s \sin\left(s\pi \frac{x}{L}\right) e^{i\omega_s t} = q(x,t)$$

Frank L. H. Wolfs

Department of Physics and Astronomy, University of Rochester, Slide 12

12

Wave solution.

- If the displacement and velocity at $t = 0$ are known, the constants in the expression for q can be determined.
- In order to find these constants, we multiply each side by $\sin(r\pi x/L)$ and integrate x between 0 and L . We use the following fact:

$$\int_0^L \sin\left(s\pi \frac{x}{L}\right) \sin\left(r\pi \frac{x}{L}\right) dx = \frac{1}{2} \int_0^L \left\{ \cos\left((s-r)\pi \frac{x}{L}\right) - \cos\left((s+r)\pi \frac{x}{L}\right) \right\} dx = \frac{L}{2} \delta_{rs}$$

Frank L. H. Wolfs Department of Physics and Astronomy, University of Rochester, Slide 13

13

Problem 13.2

- Rework the problem in Example 13.1 in the event that the plucked point is a distance $L/3$ from one end. Comment on the nature of the allowed modes.
